Experiment 9: AI and Analytics Using Zia

Aim:

To use Zia AI in Zoho Creator to analyze library information, generate meaningful insights, summarize application data, and support efficient decision-making in the Library Book Issue Management application.

Description:

Zia is an AI-powered assistant available in Zoho Creator that helps users interact with application data through natural-language prompts. It simplifies the process of obtaining information by allowing users to describe their requirements in ordinary language instead of manually examining every record. AI-assisted analysis can help users understand data more easily and identify information that is useful for application management.

In this experiment, Zia was used in the Library Book Issue Management application to obtain information related to book availability and book issue requests. A suitable prompt was entered requesting a summary of library information, including available books, issue requests, and pending requests. Based on the prompt, Zia generated a text-based response that presented the requested information in a readable format.

The generated response was reviewed to understand how AI can assist in interpreting application information. Instead of manually checking multiple records, users can provide a specific question or instruction and receive a summarized response. This approach can save time, simplify information retrieval, and make application data easier to understand.

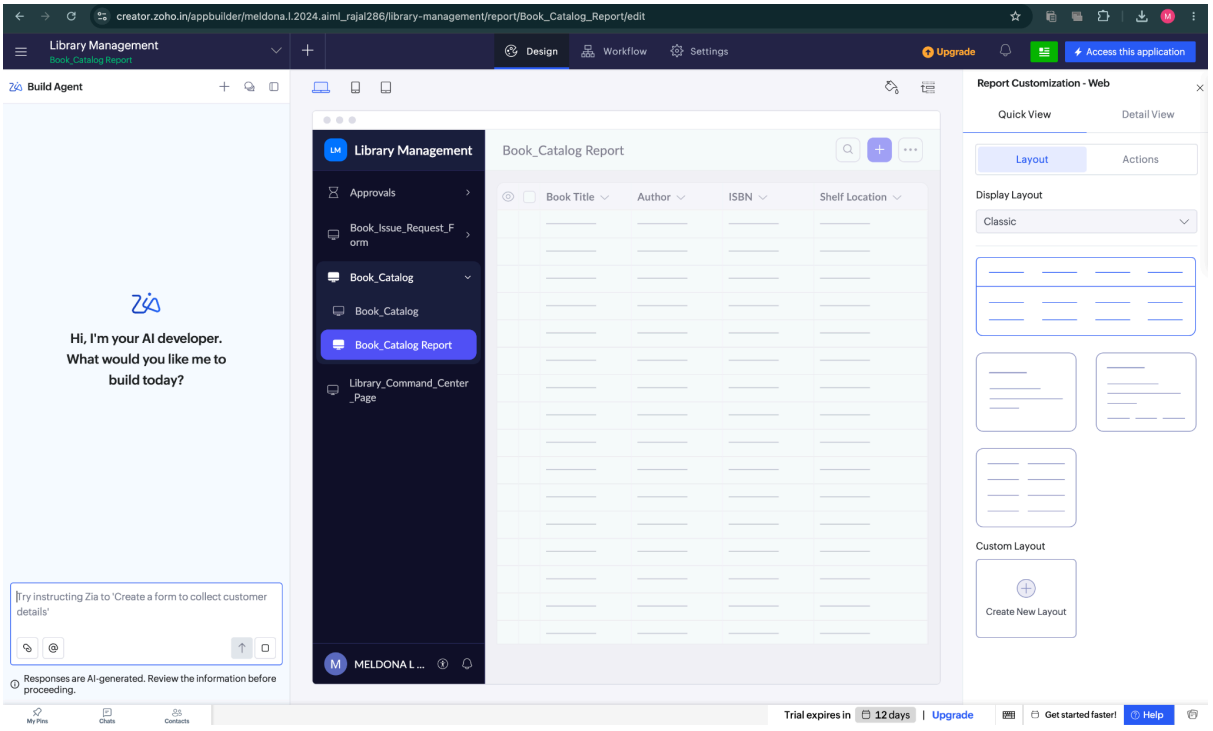

AI-assisted analysis can be useful in library management in several ways. Information about book availability can help staff understand which books are available for issue. Summaries of book issue requests can help them review borrowing activity and identify requests that may require attention. Similarly, analysis of pending requests can support the organization of daily library activities and improve the management of book circulation.

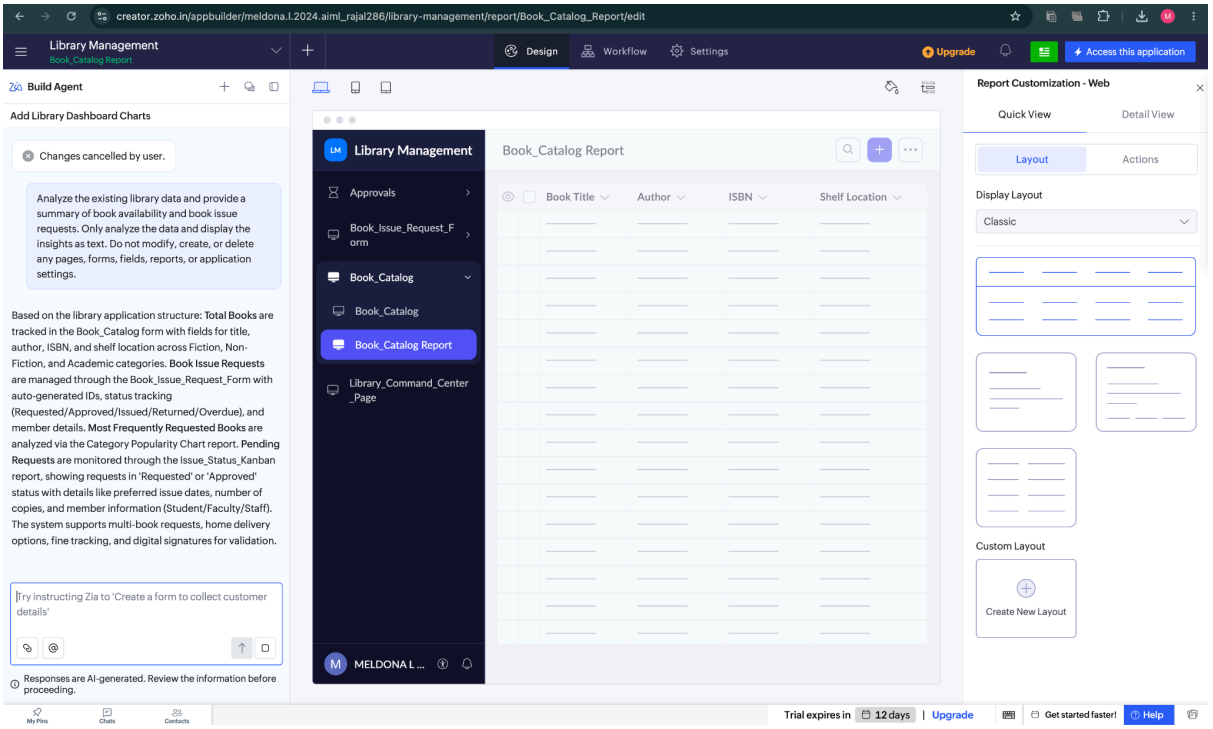

Zia can also help users explore application information by using different prompts according to their requirements. For example, users may request summaries of book records, comparisons of available information, or explanations of specific data. The usefulness of the response depends on the prompt, the available data, and the capabilities enabled in the Zoho Creator account.

During this experiment, a natural-language prompt was used to obtain a text-based response from Zia without intentionally modifying the existing forms, reports, or application settings. The generated response was reviewed to understand the role of AI in presenting information in a simple and organized manner.

It is important to verify AI-generated information against the actual application records before using it for administrative decisions. If the response is based only on the prompt rather than actual connected records, it should be treated as general information rather than a verified analysis of library data.
Therefore, checking the accuracy and relevance of the response is an important part of using AI responsibly.

This experiment demonstrates the potential of AI-assisted analysis to improve information access, simplify data interpretation, and support library administration. By combining application data with suitable AI features, Zoho Creator can help users work with information more efficiently and make better-informed decisions.

Result:

Zia was used in Zoho Creator to generate a text-based response about library management information. The experiment demonstrated how natural-language prompts and AI-assisted responses can simplify information retrieval, support data interpretation, and assist decision-making in the Library Book Issue Management application.
